

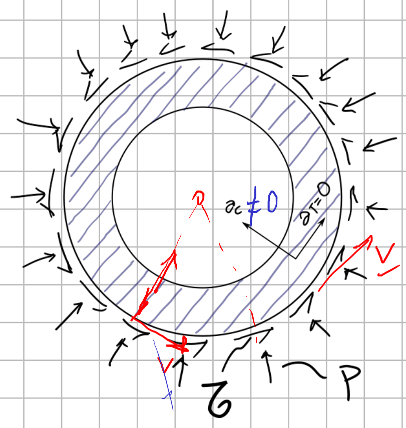
ω es constante $\rightarrow a_T = 0$

$I_r \cancel{\alpha_r}^{0}$

$$\Sigma M_z = T_e - T = 0 \Rightarrow \boxed{T_e = T}$$

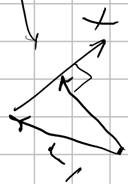


Balance de cantidad de mov. angular sobre cuerpo de fluido:

$$\oint_S \underline{r}\times\underline{T}\, dS + \int_B \cancel{\underline{r}\times\underline{X}}^{0}\, dv = \frac{D}{Dt}\int_B \underline{r}\times\underline{v}\rho\, dv$$

$\underline{T}\cdot\underline{n}$

$\frac{\underline{r}}{\|\underline{r}\|}$



$T_e = \oint \tau$

$$\frac{D}{Dt}\int_{B_1} \underline{r}\times\underline{v}\rho\, dv + \int_{B_2} \underline{r}\times\underline{v}\rho\, dv$$

$$\int_{B_1} \underline{r}\times\frac{D}{Dt}(\underline{v})\rho\, dv + \ldots$$

$$\underline{r}\times a_c\frac{\underline{r}}{\|\underline{r}\|} = a_c\frac{\overbrace{\underline{r}\times\underline{r}}^{0}}{\|\underline{r}\|}$$

$$\boxed{\oint_S \underline{r}\times\underline{T}\, dS = 0}$$
