

ω is constant $\rightarrow a_r = 0$

$$\sum M_z = T_e - T = 0 \Rightarrow \boxed{T_e = T}$$

Balance de cantidad de mov. angular sobre cuerpo de fluido:

$$\oint_S \underline{r} \times \underline{T} dS + \int_V \underline{r} \times \underline{\rho} dV = \frac{D}{Dt} \int_V \underline{r} \times \underline{v} \rho dV$$

$$T_e = \oint \underline{r} \times \underline{v}$$

$$\frac{D}{Dt} \int_{B_1} \underline{r} \times \underline{v} \rho dV + \int_{B_2} \underline{r} \times \underline{v} \rho dV$$

$$\int_{B_1} \underline{r} \times \frac{D(\underline{v})}{Dt} \rho dV + \dots$$

$$\int_{B_1} \underline{r} \times \frac{\partial \underline{v}}{\partial t} \rho dV = \int_{B_1} \frac{\partial}{\partial t} \underline{r} \times \underline{v} \rho dV$$

$$\oint_S \underline{r} \times \underline{T} dS = 0$$
